

New Born Calf Serum

VEAL

EUROPE

Description

Biowest New Born Calf Serum (NBCS) is obtained from coagulated whole blood collected from calves less than 20 days old. Following centrifugation, the serum is processed and sterile-filtered through 0.2 µm filters.

Used in cell culture applications, New Born Calf Serum provides a source of serum proteins and other naturally occurring components. It can also be used as a blocking reagent in biochemical assays.

Each batch undergoes quality control testing, including endotoxin, haemoglobin and total protein levels, as well as mycoplasma and Bovine Viral Diarrhea Virus (BVDV) testing. Biowest ensures traceability of the serum from collection through processing and final packaging.

Product information

Frozen

-18°C to -40°C

60 months

Applications

Cell culture

Blocking reagent for biochemical assay

Ordering information
